1b. Buatlah fungsi rekursif Mencari hasil a kali n ( $a * n$ ) dengan menggunakan penjumlahan.

Fungsi\_kaliperjumlahan

Fungsi ini merupakan fungsi rekursif dimana untuk mencari hasil kali dengan penjumlahan, dimana variable a dan n bertipe integer.

```
int kaliperjumlahan(int a, int n){  
    if (n == 0)  
        return 0;  
    else  
        return x + kalijumlah(a, n-1);  
}
```

Algoritma utama

1. [mulai]

[Masukkan nilai a]

Read (a)

2. [Masukkan nilai n]

Read (n)

3. [Memanggil fungsinya dan tampilkan hasilnya]

Write ("Perkalian dari" a "dengan" n "adalah" kaliperjumlahan(a,n)

4. [selesai]

Halt

2b. membuat notasi postfix dari  $(A * B + C / D + E ^ (E \text{ div } C) - (D - E / (F + G)))$

=  $AB^* + CD / + E ^ E \text{div } C \text{ DE} - F + G / -$

3b. Setiap mahasiswa mengerjakan soal ujian yang terdiri dari 10 pertanyaan yang memilih satu dariempat pilihan (PG).

- i. struct mahasiswa{
 

int kode\_mahasiswa[100];
 int jawaban[100];
 int nilai[100];

 };
- ii.
  1. [looping untuk meminta jawaban]
 

for (int i=1; i<=10; i++){
 2. Write ("Jawaban - " << i << " = ")
 Read (mhs.jawaban[i])
 }
- iii.
  1. [Looping untuk menginput kunci jawaban]
 

for (int i=1; i<=n; i++){
 2. [meminta user untuk menginput kode]
 Read (mhs.kode\_mahasiswa[i])
 3. [Looping untuk menginput kunci jawaban]
 for (int j=1; j<=10; j++){

```

4. [Menampilkan jawabannya]
Write ("Jawaban - " j " = ")
[Meminta user untuk memasukkan nilai]
Read (nilai[j])
    }
}

```

```

iv.   for (int i=1; i<=10; i++){
      for (int j=1; i<=10; i++){
      if (mhs.jawaban[i] == mhs.nilai[j]){
      skor = 10;

```

```
